# Built-in (security) Features

- » modular support for crypto primitives
- » Rekeying for longer sessions
- » both sides authenticated
- » modular protocol (Trans, User, Conn)
- » privilege Separation

# ssh -Q cipher

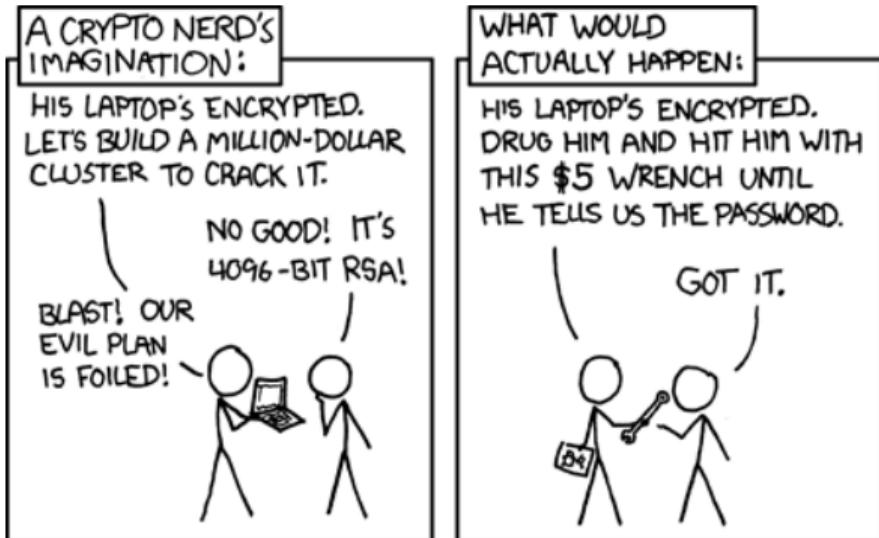

- » 3des-cbc
- » blowfish-cbc
- » cast128-cbc
- » arcfour
- » arcfour256
- » aes128-cbc
- » aes128-ctr
- » aes256-ctr
- » aes128-gcm@openssh.com
- » aes256-gcm@openssh.com
- » chacha20-poly1305@openssh.com

# ssh -Q cipher-auth

- » aes128-gcm@openssh.com
- » aes256-gcm@openssh.com
- » chacha20-poly1305@openssh.com

# Rekeying

## RekeyLimit

Specifies the maximum amount of data that may be transmitted before the session key is renegotiated, optionally followed a maximum amount of time that may pass before the session key is renegotiated. The first argument is specified in bytes and may have a suffix of [..], respectively. The default is between ‘1G’ and ‘4G’, depending on the cipher. The optional second value is specified in seconds [..]. The default value for RekeyLimit is default none, which means that rekeying is performed after the cipher’s default amount of data has been sent or received and no time based rekeying is done.

# Protocol recap

Channel 2 TCP Forward

Channel 1 Agent

Channel 0 Shell

Conn

(User)Auth

User

Server

Trans

# Scenario: Server authentication

## Hostkey Validation?!

- » TOFU
- » 'local Database' ( ./ssh/known\_hosts)
- » GlobalKnownHostsFile (/etc/ssh/ssh\_known\_hosts)
- » SSHFP Records (dnssec)
- » UpdateHostKeys (man 5 ssh\_config)
- » SSH CA -> ( AUTHORIZED\_KEYS FILE FORMAT section)

# Scenario: Working remotely

» ssh user@host

# Scenario: Working remotely

- » ssh user@host
- (😢) Password, sucks.

# Scenario: Working remotely

- » ssh user@host
- :( Password, sucks.
- » ssh-keygen
- » ssh-copy-id || cat .ssh/authorized\_keys < id.pub
- » ssh user@host [-i id.pub]

# Scenario: Working remotely

- » ssh user@host
- :( Password, sucks.
- » ssh-keygen
- » ssh-copy-id || cat .ssh/authorized\_keys < id.pub
- » ssh user@host [-i id.pub]
- :( again pass, still sucks, but in a more secure way

# Client Security - Keys

```
$ file rsa4key
```

- ▶ rsa4key: PEM RSA private key
- » ssh keygen -o (or newer OpenSSH or ed25519 keys)

```
$ file newformat_id
```

- ▶ newformat\_id: OpenSSH private key

# Client Security - SSH Agent

## » ssh-agent / gpg-agent

```
1 $ env | grep -i auth
2 SSH_AUTH_SOCK=/tmp/ssh-srFyhRtSTS3V/agent.2185
3
4 agent-security:
5 $ ls -l /tmp/ssh-srFyhRtSTS3V/agent.2185
6 srw----- 1 andre andre 0 May 23 15:23 /tmp/ssh-srFyhRtSTS3V/agent.2185
```

## » ssh-add -c key (type **y e s**)

» -l

» -D / -d key

» -x (to lock)

# /.ssh/config

```
1 Host *
2   KexAlgorithms curve25519-sha256@libssh.org,diffie-hellman-group-exchange
3     -sha256
4   Ciphers chacha20-poly1305@openssh.com, aes256-gcm@openssh.com
5
6 Host box
7   VisualHostKey yes
8   Identityfile legacyKey
9   Ciphers +3des-cbc
10  HostKeyAlgorithms +ssh-dss
11
12 Host Jump.box
13   User andre
14   ForwardAgent yes
15   Port 4242
16   DynamicForward 33334
```

# Scenario: SSH CA

- » id\_rsa
- » id\_ed25519
- » id\_??-cert ?

# Scenario: SSH CA

- » id\_rsa
- » id\_ed25519
- » id\_??-cert ?

## rfc4251: Section 4.1

- o The client has a local database that associates each host name (as typed by the user) with the corresponding public host key. [...]
- o The host name-to-key association is certified by a trusted certification authority (CA).  
[...]

# Scenario: SSH CA

- » id\_rsa
- » id\_ed25519
- » id\_??-cert ?

## rfc4251: Section 4.1

- o The client has a local database that associates each host name (as typed by the user) with the corresponding public host key. [...]
- o The host name-to-key association is certified by a trusted certification authority (CA).  
[...]

The SSH protocol currently supports a simple public key authentication mechanism. Unlike other public key implementations, SSH eschews the use of X.509 certificates and uses raw keys.

# SSH Key signing/CA

- » ssh-keygen -f ssh-ca -b 4096
- » echo "cert-authority \$(cat ssh-ca.pub)">>>> /.ssh/authorized\_keys
- » ssh-keygen -s signing-key -l key-identifier -h -n hostname -V +52w host-key

# SSH Key signing/CA 2

- » automation (fetch with ansible, delegate\_to signign host, deploy)
- » there are 'tools'.

# SSH Key signing/CA 2

- » automation (fetch with ansible, delegate\_to signign host, deploy)
- » there are 'tools'.

Issues?

- » Vendorsupport?
- » revocation, decommissioning
- » renew (for short lived)
- » function User (sign-in commands)
- » binding user-key

# shd\_config

- » Rootlogin (prohibit-password)
- » AllowUsers/Groups
- » Match blocks
- » PubkeyAcceptedKeyTypes
- » AuthenticationMethods publickey,password publickey,publickey

# Scenario: Pubkey + 2FA

```
1| AuthenticationMethods publickey,password
```

```
1| local ~ \$ ssh root@box
2| Authenticated with partial success.
3| root@box's password:
4| Welcome to box
```

# Hardening

- » no CBC, RC4 Cipher
- » no old Hash-Algs ( < sha256 )
- » no pass-auth
- » keep private keys private (no github)
- » >= rsa2048
- » authorized\_keys in central place

# Hardening

- » no CBC, RC4 Cipher
- » no old Hash-Algs ( < sha256 )
- » no pass-auth
- » keep private keys private (no github)
- » >= rsa2048
